И НАУКАТА

Група № 3.2.1: Фотоанизотропни материали за приложения в поляризационната холография и фотониката

Водещ изследовател: проф. д-р Лян Неделчев

Годишна конференция по проект „BiOrgaMCT“
5 декември 2023, ХТМУ – зала „Асен Златаров“

РП 1 Отлагане и характеризиране на слоеве от фотоанизотропни материали

- Приготвяне на образци от фоточувствителни органични материали, вкл. нови
- Определяне на спектри на пропускане и отражение на образците, механични свойства и др.
- Наблюдение на процеса на съхнене на оптичните слоеве; определяне на контактния ъгъл на разтвори на изследваните вещества

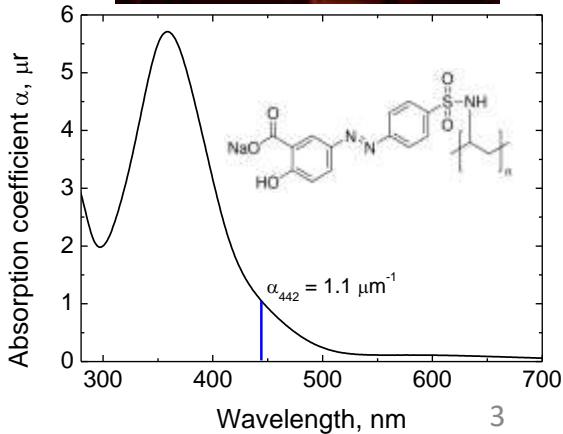

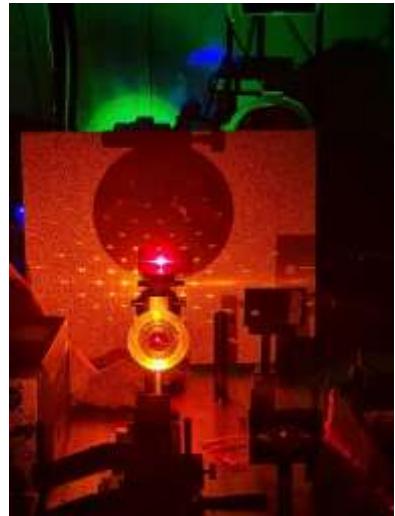

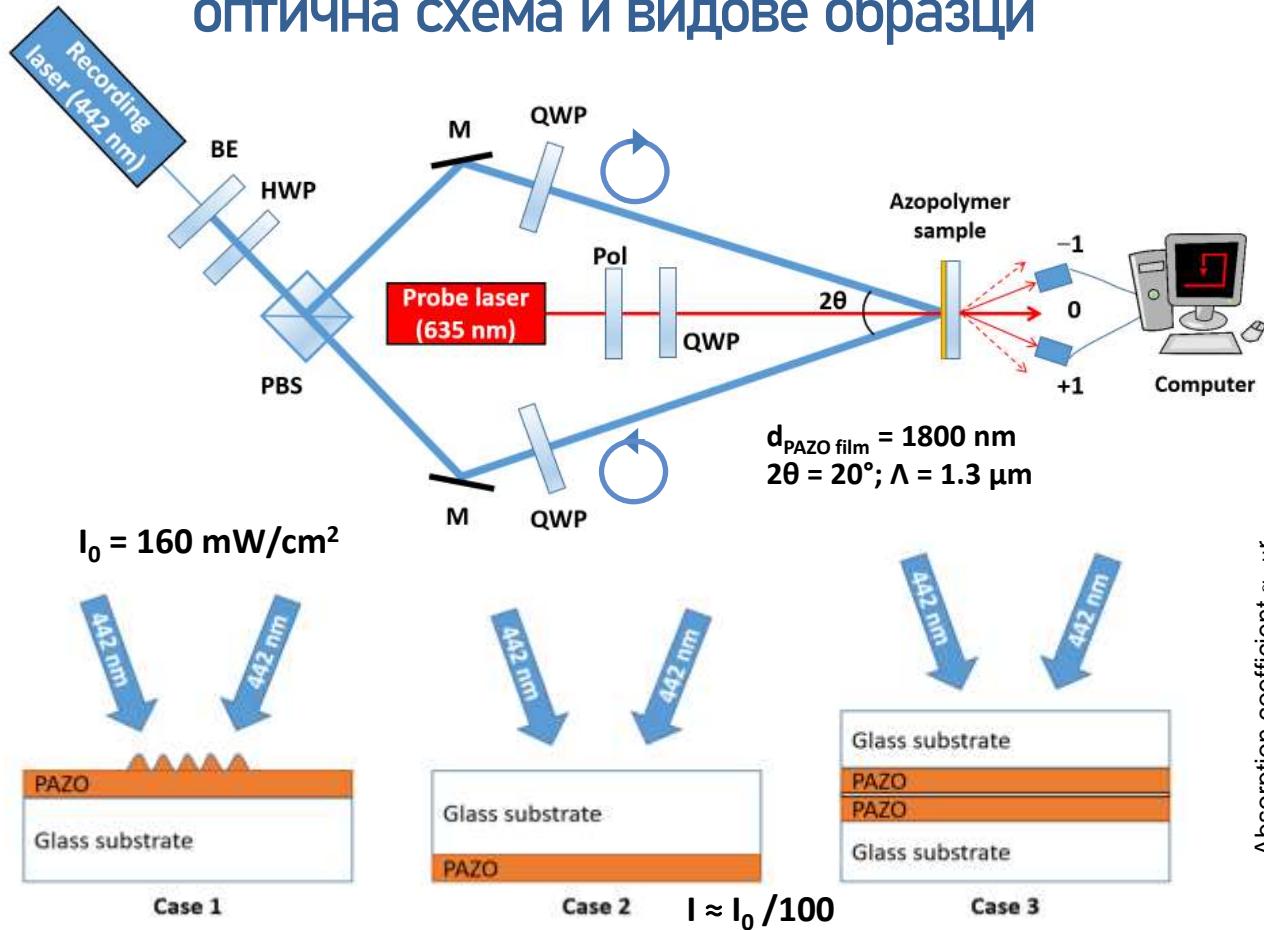

РП 2 Поляризационен холографски запис на дифракционни структури, обемни и повърхностни решетки

- Запис на поляризационни холографски решетки (PHG)
- Запис на 2D PHG и/или поляризационни холографски лещи (PHL)
- Изследване на фотоиндуцирани хирални структури

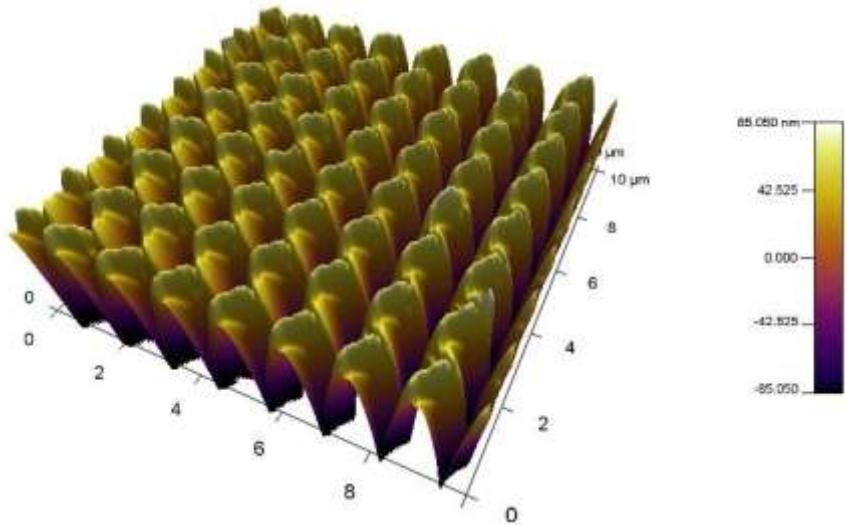

РП 3 Характеризиране на поляризационни холографски решетки за приложения във фотониката

- Поляриметричен анализ на поляризационна/скаларна решетка
- AFM изследване на повърхностни релефни решетки
- Метализиране на повърхностно релефни решетки за приложения във фотониката

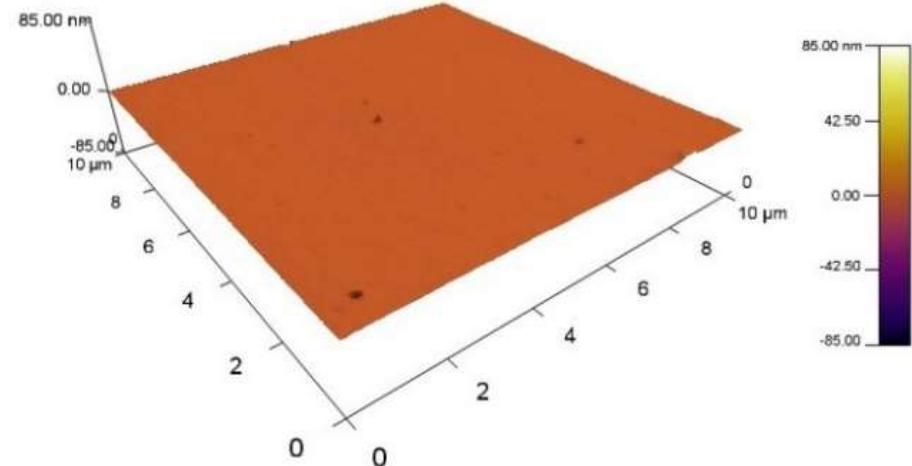

Запис на 2D холографски решетки със и без повърхностен релеф – оптична схема и видове образци

2D холографски решетки със и без повърхностен релеф – AFM анализ

case 1

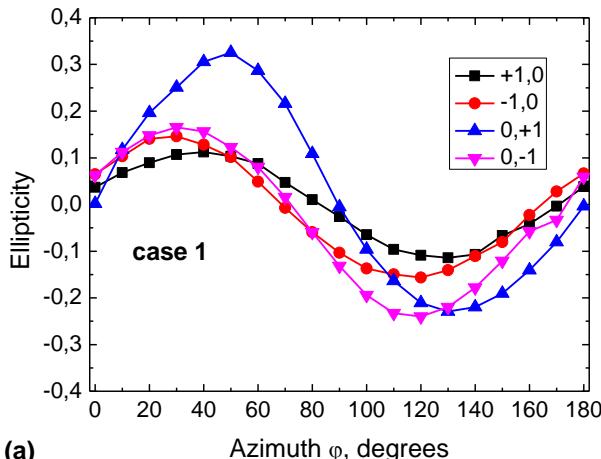

case 2

Mateev, G., Nedelchev, L., Nikolova, L., Ivanov, B., Strijkova, V., Stoykova, E., Choi, K., Park, J., Nazarova, D. Two-dimensional polarization holographic gratings in azopolymer thin films: Polarization properties in the presence or absence of surface relief. *Photonics* **10**, 728 (11 pp), 2023.

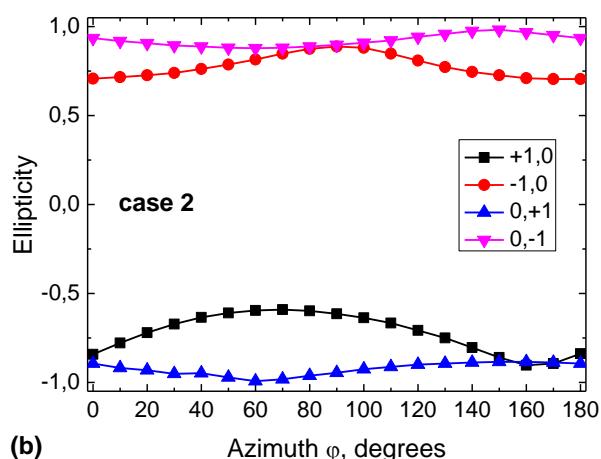

2D холографски решетки със и без повърхностен релеф – поляризационни свойства

$e_{in} = 0$ (линейна поляризация); $\phi = 0 \div 180^\circ$

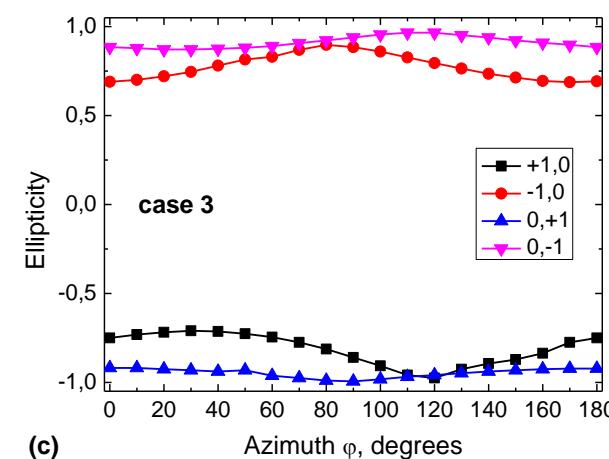

(a)

доминират скаларните свойства
на повърхностната решетка

(b)

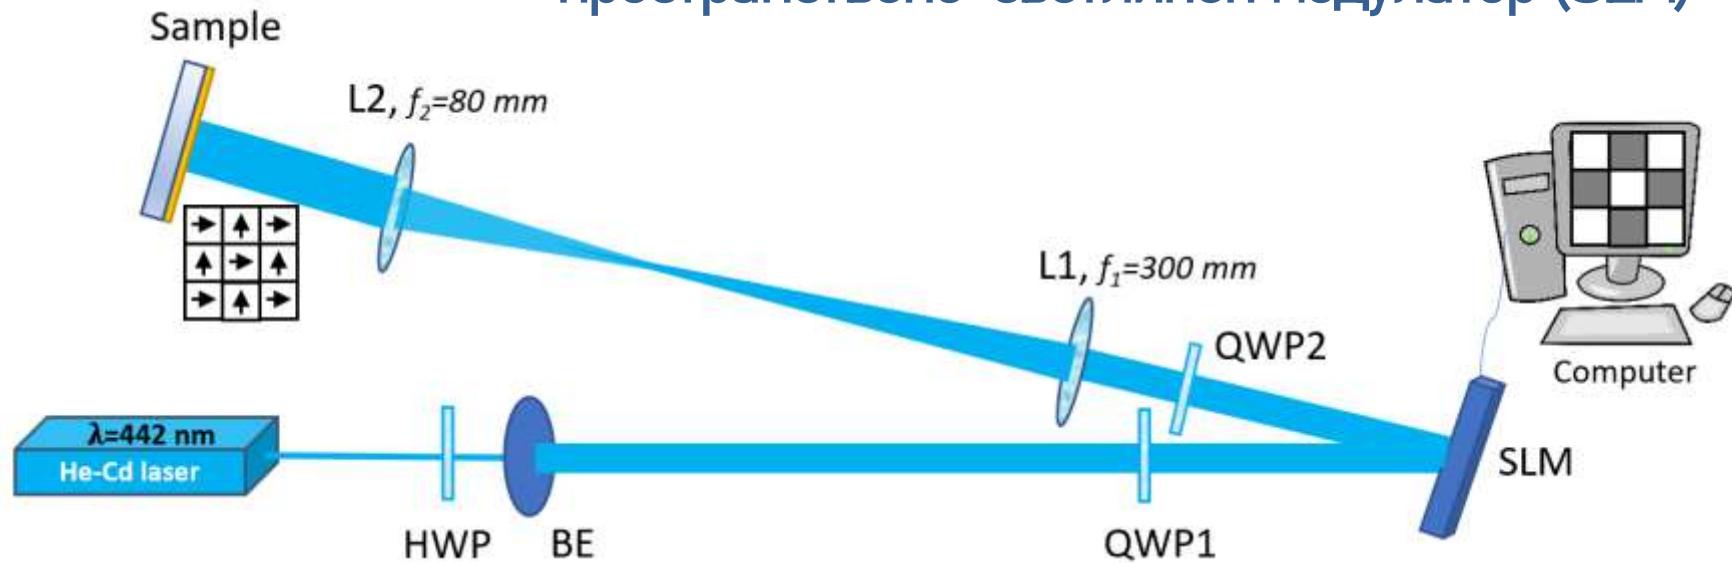

доминират поляризационните свойства
на обемната решетка

(c)

Mateev, G., Nedelchev, L., Nikolova, L., Ivanov, B., Strijkova, V., Stoykova, E., Choi, K., Park, J., Nazarova, D. Two-dimensional polarization holographic gratings in azopolymer thin films:
Polarization properties in the presence or absence of surface relief. *Photonics* **10**, 728 (11 pp), 2023.

Цифрова поляризационна холография – оптична схема, използвща пространствено-светлинен модулатор (SLM)

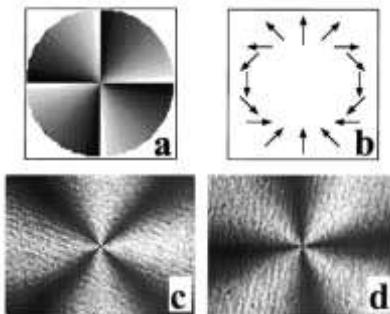

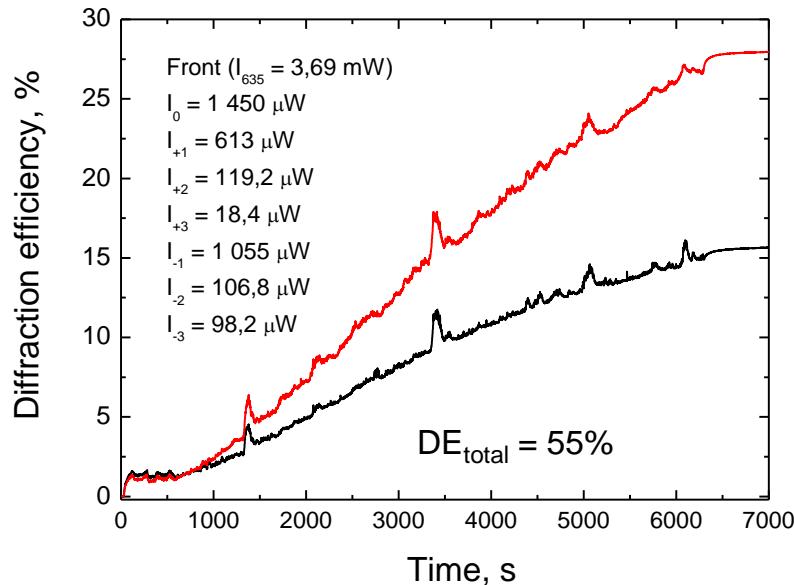

Spatial light modulator (SLM):

- Model: LETO-3 (HOLOEYE Photonics AG)
- Resolution: 1920×1080 pixels
- Pixel pitch: $6.4 \mu\text{m}$
- Compact driver unit

Предизвикателство: установена е промяна на фазовата разлика на SLM-а по време на експеримента поради загряване

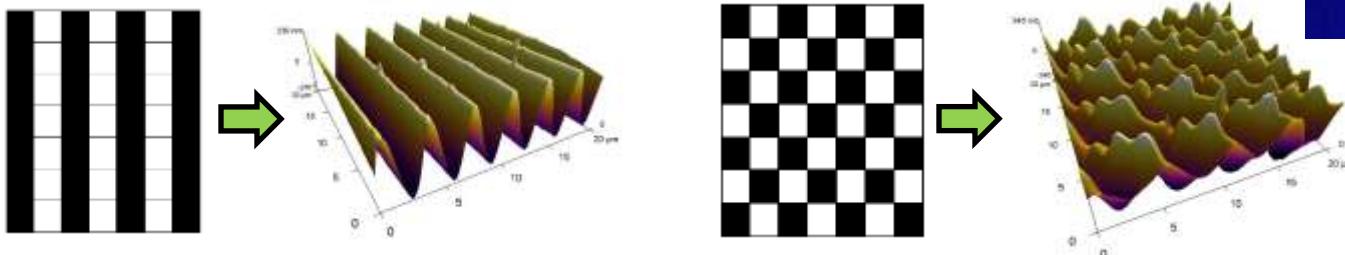

Решение: темпериране на помещението, поставяне на радиатор за охлаждане на SLM-а

Цифрова поляризационна холография: кинетики на запис, AFM анализ

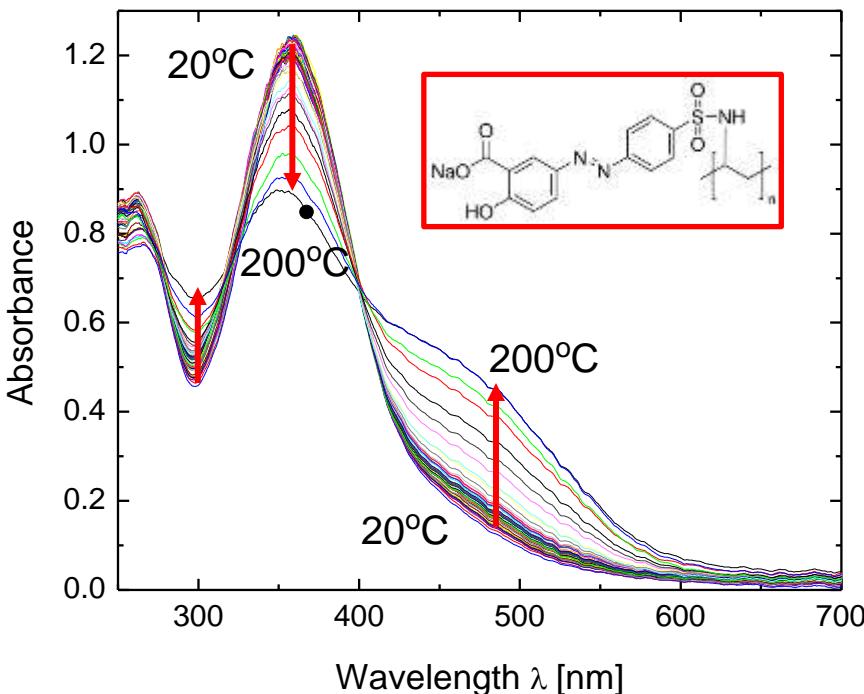

Предимства: чрез една експозиция могат да се получат 2D решетки, вкл. със сложна структура;

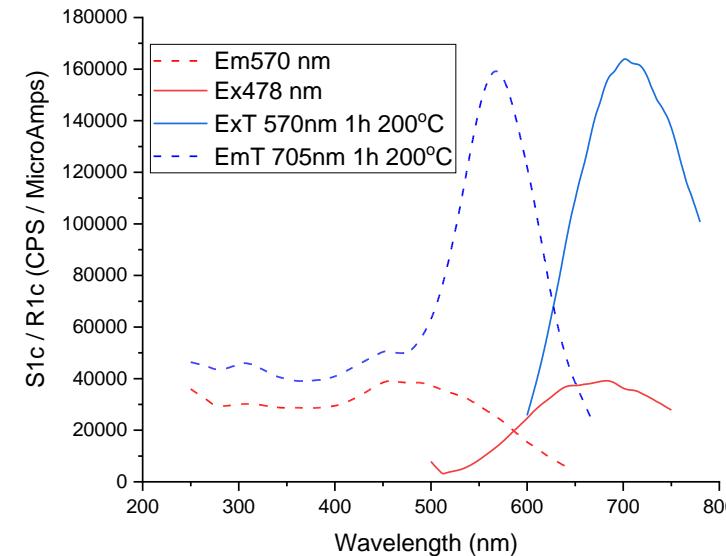

Ограничение: размера на пикселите на SLM-а;

Температурна зависимост на абсорбционните спектри на PAZO, флуориметричен анализ

Спекти на погълтане на тънки слоеве от PAZO в
зависимост от температурата на образца

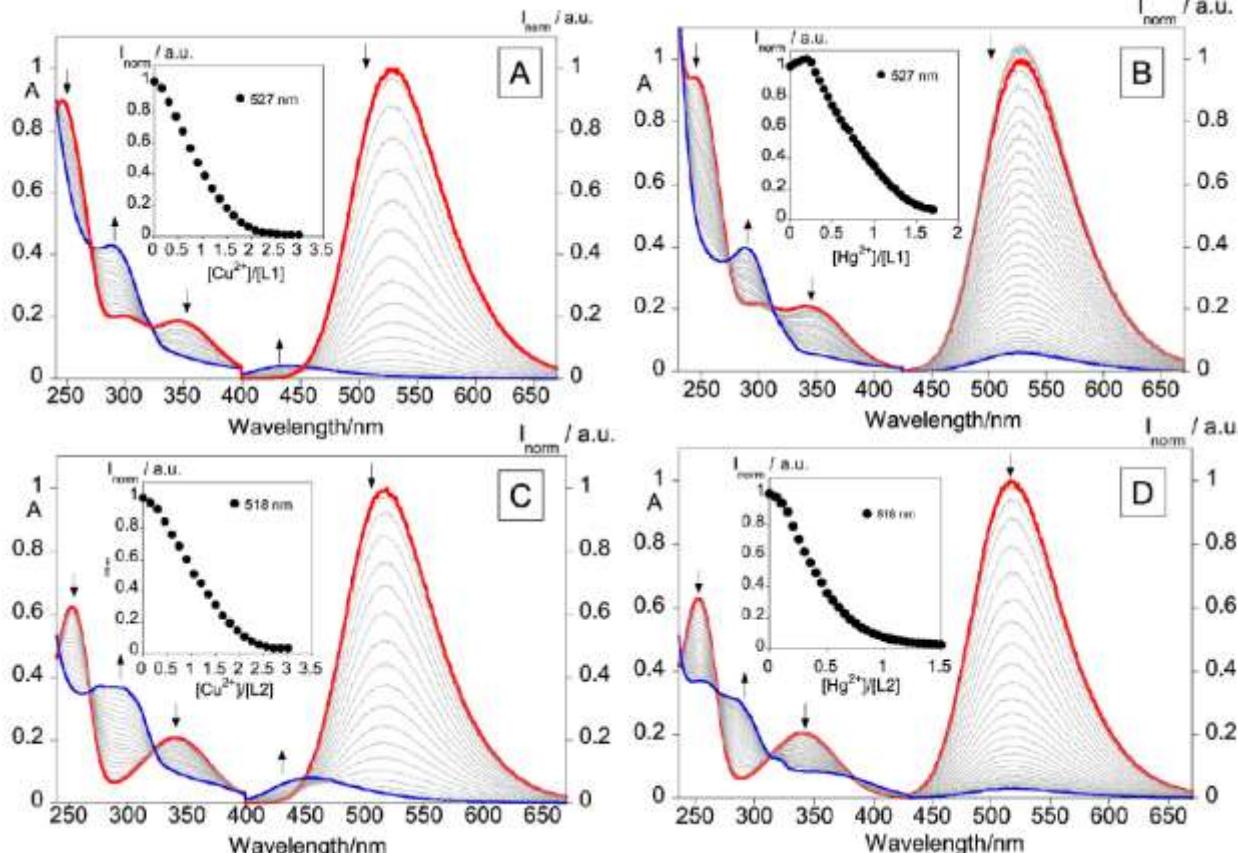

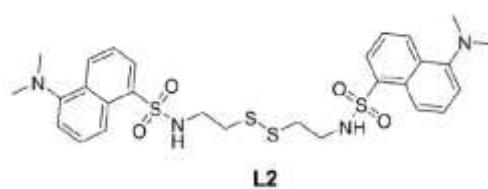

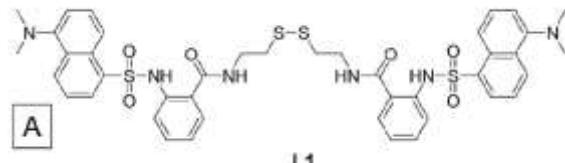

Флуоресцентни спекти на ПАЗО: слоеве при стайна
температура и нагрети до 200°C.

Спектрите на емисия (Em) са снети при възбудждане (Ex)
478 nm и 570 nm за нагретите образци.

Спекти на възбудждане (Ex) са снети при емисия (Em) от
570 nm, а за нагретите слоеве – 705 nm.

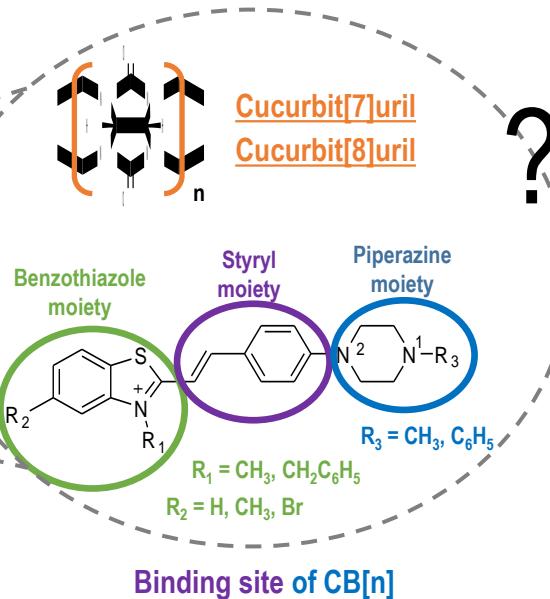

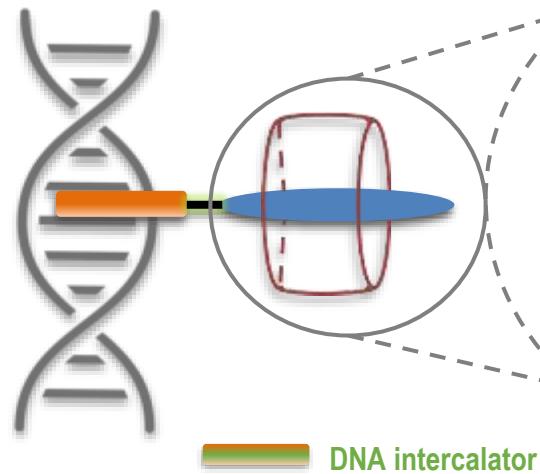

Спектрофотометрични и спектрофлуориметрични изследвания на две данзилни производни

Dyes and Pigments **218**, 111428 (11 pp), 2023.
IF: 4.5 Q1

N-Methyl- and N-Phenylpiperazine Functionalized Styryl Dyes inside Cucurbiturils: Theoretical Assessment of the Factors Governing the Host-Guest Recognition

DNA-ligand-CB[n] ternary complexation

- ✓ С методите на изчислителната химия е изследвана термодинамиката на процесите на образуване на комплекси от типа домакин-гост на 12 багрила и две системи-домакини CB[7] и CB[8];
- ✓ Серията багрила с потенциално приложение като багрила за ДНК и тераностици е изследвана експериментално от Zonjić и съавтори [doi:10.1016/j.bioorg.2022.105999];
- ✓ Комплексообразуването на стириловите багрила с молекулите-домакини влияе положително на тяхното действие като ДНК интеркалатори и квадруплексни стабилизатори, повишава и флуоресцентния добив.

Abstract: Photoanisotropic materials, in particular anisoles and azopolymers, have attracted significant research interest in the last decades. This is due to their applications in polarization holography and 4G optics, enabling polarization-selective diffractive optical elements with unique properties, including circular polarization beam-splitters, polarization-selective bifocal lenses, and many others. Numerous methods have been applied to increase the photoinduced birefringence of these materials, and as a result, to obtain polarization holographic elements with a high diffraction efficiency. Recently, a new approach has emerged that has been extensively studied by many research groups, namely doping azobenzene-containing materials with nanoparticles with various compositions, sizes, and morphologies. The resulting nanocomposites have shown significant enhancement in their photoanisotropic response, including increased photoinduced birefringence, leading to a higher diffraction efficiency and a larger surface relief modulation in the case of polarization holographic recordings. This review aims to cover the most important achievements in this new but fast-growing field of research and to present an extensive comparative analysis of the result, reported by many research groups during the last two decades. Different hypotheses to explain the mechanism of photoanisotropy enhancement in these nanocomposites are also discussed. Finally, we present our vision for the future development of this scientific field and outline its potential applications in advanced photonics technologies.

1. Introduction

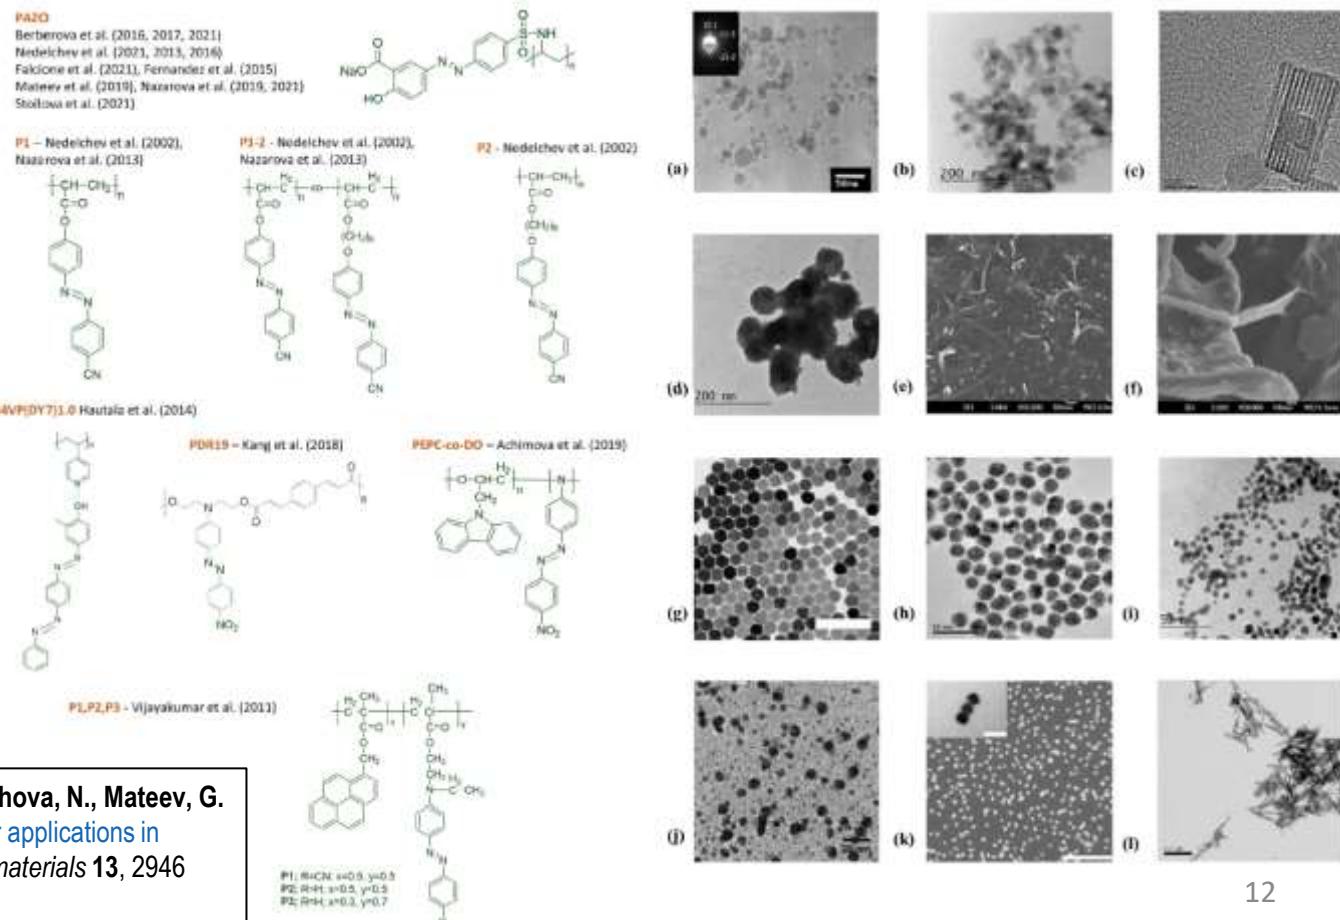

The demand for new materials to develop modern technologies is constantly growing. Although nanocomposite (NC) materials have been in use for a long time, they are constantly being improved to enable increasingly advanced applications. The new materials, obtained by combining two or more materials on nanoscale level, in most cases not only combine the qualities of their components, but also yield new, advantageous properties. In many cases, the nanoparticles (NPs) incorporated in nanocomposite materials modify and improve the optical, mechanical, and electrical properties of the matrix.

The optical properties of nanocomposite materials have been used since ancient times. Stained glass windows and ancient works of art exemplify their applications. A popular example of the intriguing optical features of nanocomposites is the Lycurgus cup from the 4th century AD [1]. In this case, the basis is the effect obtained from the excitation of the surface plasmon resonance due to the presence of gold and silver nanoparticles in the glass, which is expressed in a change in the color of the cup depending on whether it is viewed in transmission or reflection.

Обзорна статия за нанокомпозитни фотоанизотропни материали

Разгледани са оптичните и фотоанизотропни свойства на широк набор от нанокомпозитни материали, съдържащи азополимери и азобагрила с различен химичен състав, дотирани с метални или неметални наночастици. Обзорът е с обем 38 стр., обхваща 224 източника и се базира на 10-годишните изследвания на нашата група върху този клас оптични материали.

Регистрираните участници в уебинара са над 200 души от целия свят. Уебинарът премина при изключителен интерес, с над 15 зададени въпроса от участниците. Пълният видеозапис на лекцията е достъпен на сайта на престижната организация OPTICA (formerly Optical Society of America – OSA).

IBPhBME LIGHT for LIFE Seminar Series 2023
LIGHT-BASED PROCESSES AND TECHNOLOGIES FOR SUSTAINABLE FUTURE
Sofia, Bulgaria, Bulgarian Academy of Sciences
Acad. G Bonchev Str. Bl. 21, Room 2, 16.05.2023, 13 – 17.30 h

Organizers:

- Institute of Biophysics and Biomedical Engineering
- Institute of Plant Physiology and Genetics

Main topics:

- Light-induced biological processes
- Light sources in life sciences, biomedicine and nanotechnology
- Advanced communication and optical technologies

Invited speakers:

Prof. Lian Nedelchev – Institute of Optical Materials and Technologies "Acad. Jordan Malinovski", Bulgarian Academy of Sciences
Prof. Natalia Krasteva – Institute of Biophysics and Biomedical Engineering, Bulgarian Academy of Sciences
Assoc. Prof. Kiril Mishev – Institute of Plant Physiology and Genetics, Bulgarian Academy of Sciences
